## MICHELL'S GREEN VELVET LAWN GRASS SEED

Our Green Velvet Lawn Mixture is composed of only the finest, extra recleaned grasses, carefully blended and will produce a permanent evergreen lawn.

We recommend sowing 1 quart of seed to a space 10 x 10 feet, 1 peck to 1000 square feet, one bushel to 4000 square feet, 6 to 8 bushels per acre on new lawns; for reseeding, sow 4 to 5 bushels per acre.

Price: 45c. per qt.; 4 qts., \$1.50; \$2.50 per pk.; bu. (20 lbs.), \$9.00; \$44.00 per 100 lbs.; 1000 lbs., \$425.00

We have been specializing in lawn grass seeds for over 40 years and no effort or expense is spared in order to obtain the highest quality seeds, which are all procured direct from the producing sections, both in Europe and America. Our grass seed representative makes frequent trips to the growing sections to inspect the various crops and to personally see that we get only the very choicest recleaned seed.

For complete list of Grasses see pages 4 to 7

## GENERAL INFORMATION AND SUGGESTIONS

CONDITIONS OF SALE.—All contracts, sales and acknowledgments of orders are contingent upon crop failures, our ability to import and make deliveries in conformity with the "Plant Quarantine Act," partial deliveries by growers or manufacturers, strikes, or other unavoidable causes beyond our control, clerical errors included; also unsatisfactory credit standing. All quotations are subject to market changes and goods being unsold on receipt of order. Henry F. Michell Co. give no warranty, expressed or implied, as to the description, purity or productiveness of any seeds, plants or bulbs they send out, and they cannot be in any way responsible for the crop. If the customer does not accept the goods on these terms, he must notify us at once and we will give instructions for the disposition of the goods.

ORDER EARLY.—We shall appreciate it if our customers will send us their orders for seeds, plants, bulbs, etc., during January and February. Shipment need not be made until they want the goods.

PACKING CHARGES.—No charge is made for boxes or packing, except for two-bushel seamless sacks which are charged at market value (and as may otherwise be noted), these bags are returnable for credit at the price charged.

BUSINESS TERMS .- We especially invite charge accounts, which are more convenient than to remit for each order at the time it is sent us. When sending your first charge order, please send us the names and addresses of two or more business houses with whom you have had past or present credit relations; this saves considerable time in the execution of your first charge

As to our responsibility, we refer you to Dun's or Bradstreet's Mercantile Agency, or any bank or trust company in the United States.

C. O. D. SHIPMENTS.—Goods can be sent C. O. D. (with the exception of perishable items, which include plants and cold storage bulbs; these cannot be sent C. O. D.). No. C. O. D. shipments for any kind of goods can be made by express or freight out of town unless a partial remittance accompanies the order. No C. O. D. orders can be accepted where the amount is less than \$1.00. During April and May, owing to the heavy volume of business transacted, we are not in a position to accept order for shipment C. O. D., unless a partial payment has been made on account to assure acceptance at time of delivery.

CHANGES OF RESIDENCE.—In order that we may forward our Catalogs regularly, we would suggest that our customers inform us of a change of permanent residence.

SHIPPING INSTRUCTIONS.—Always state by what method you want goods forwarded, otherwise we will ship according to our best judgment.

FORWARDING SERVICE. — We pay postage charges on all orders for vegetable seeds, flower seeds and grass seeds in quantities up to five pounds (unless otherwise noted) to the first and second zones. If larger quantities of the above, also bulbs, plants and sundries are wanted by parcel post, remit for postage the amount named in connection with the item to the first and second zones; for other zones add additional postage, or at the rate quoted in table opposite. Agricultural Seeds, Implements, Fertilizers, and other heavy and bulky goods are sent by Express or Freight at purchaser's expense.

Plant orders should be separated from Seed orders, as they are usually filled and shipped separately.

Positions for Gardeners, Estate Superintendents, etc.

We have on our register the names of competent Gardeners, Superintendents, Greenskeepers, Farmers and Poultrymen who desire positions. We are always pleased to put them in communication with parties desiring services of such men.

## MICHELL'S RELIABLE GRASS SEED

#### Advantages of Sowing Mixed Grass Seeds

It is a well known fact that a well balanced combination of grasses will give better results than a separate variety. Various grasses in mixture will help crowd out weeds. Often a separate variety of seed will not thrive on certain soil but where there is a combination of seeds, one or more varieties in the combination will surely thrive and our formulas are so well blended that they will give very satisfactory results. Liberal and frequent applications are advised, especially on new ground, in order to produce a satisfactory, velvety lawn, which is always much admired.

Quantity to Sow for Lawns. We recommend sowing one quart to a space 10 x 10 feet; one peck to 1000 square feet; half bushel to 2000 square feet; one bushel to 4000 square feet or 40 x 100 feet; six to eight bushels per acre on new ground without grass; for reseeding three to four bushels per acre. For Putting Greens we advise 100 lbs. of seed for greens 100 x 100 feet. For Fairways,

8 to 10 bushels per acre. For Pasture and Hay Fields, 4 to 5 bushels per acre, based on a 20 pound bushel.

Prices quoted on Mixed Grass Seeds are prepaid in quantities up to one peck to the first and second zones; please add 20c. per ½ bu., 30c. per bu. for the above zones if wanted by parcel post; for other zones, see parcel post table, second cover page.

## MICHELL'S "DISTINCTIVE" FLOWER SEEDS

## For Novelties and Specialties see pages 8 to 10A

Our flower seeds have a reputation for their superior quality and for the excellent results obtained by sowing them. It is our constant endeavor to supply only such varieties and strains that will give the best of satisfaction.

Throughout the following pages of Flower Seeds the different varieties are designated as Annuals, Biennials, Perennials, etc.,

Throughout the following pages of Flower Seeds the different varieties are designated as Annuals, Biennials, Perennials, etc., and for the benefit of those who are not familiar with these terms, we wish to make the following brief explanation:

Annuals. These grow and bloom, mature their seed and then die in the same year, such as Asters, Balsams, Poppies, Sweet Peas, Morning Glories, etc., some of which may be sown in the house from March to May, or outdoors, after danger from frost is over.

Biennials. These grow from seed sown during mid-summer, flowering the second year, after which they die; many of the varieties bloom the first season if sown early. In this class we have Pansies, English Daisies, Campanula Medium, Dianthus, etc.

Perennials. Those which live from year to year, such as Aquilegia, Delphinium, Foxgloves, etc. Seed may be sown outdoors from June to September and transplanted late in fall into their permanent quarters, and protected during winter with a light litter of straw or leaves. The hardy perennials not usually needing any protection after the first winter; the half-hardy perennials require protection during the winter, and the tender perennials during the winter require greenhouse protection.

## MICHELL'S SUPERB ASTERS

We can imagine no other flower which combines so much beauty with grace and usefulness and with which more brilliant effects can be achieved. From July until September this flower reigns supreme in the garden, not equalled by any other. For these obvious reasons we give a great deal of attention to these flowers, and are in a position to offer our patrons remarkably fine strains, producing perfect flowers of great beauty. All of the strains we offer are grown under our own supervision by specialists in this country. To have early flowers, sow the seed in the house, hothed or cold frame, from March until May; otherwise sow outdoors after danger from frost has passed. To do well, Asters require a well pulverized soil, always kept open by continuous cultivation.

Special Note.—While this splendid fall flower is very easily grown from seed, the greatest possible care should be exercised with the seed bed; old soil and boxes should never be used the second time without thoroughly sterilizing, to avoid the numerous diseases to which Asters are so susceptible. Barnyard manure should never be employed as a fertilizer; we recommend the use of fine ground bone meal and on no account should they be grown in the same location two years in succession.

#### **FUSARIUM WILT-RESISTANT STRAINS**

We take pleasure in offering the following varieties of Wilt-Resistant Asters. These we believe to be practically immune to this disease. We feel sure that by using this seed many disappointments due to crop failures will be eliminated.

## NASTURTIUM, GOLDEN GLEAM (Novelty)

This new type is of semi-trailing habit and is a new development in Nasturtiums; the plant forms a vigorous large bush which throws out short runners, averaging 18 inches; the sweet scented, large double flowers are of a golden yellow color and average 2 to 3 inches across; they are borne on erect stiff stems six inches in length and stand well above the foliage, an arrangement which adds immeasurably to the showy appearance of the plant; they are also splendid for cutting. Strictly considered this is a biennial, but the fact that it flowers the first season from seed recommends it for an annual. There are actually three seasons in which pansies can be planted. If started in the house from February until April pansies will begin to bloom from July on; sown outdoors in May beautiful flowers are produced in the fall; sown in frames during July and August and transplanted later gives us the main crop of flowers the following spring.

## MICHELL'S SPENCER OR ORCHID SWEET PEAS

Summer Flowering Varieties

These are distinguished from the old-fashioned Grandiflora sorts by the enormous flowers with crinkled and wavy petals, and also from the fact that they usually bear four blossoms on a stem. The plants are of robust growth and bear the flowers on long stems. On account of their superiority over the Grandiflora sorts, we have discontinued listing the latter. The varieties we list are selected from a long list and are considered to be the best up-to-date varieties.

The "Collection Idea" of Vegetable Seeds is gaining in popular favor; many persons, even the experienced gardeners do not know the best varieties to order. These collections have also a decided feature of advantage, as they save time and money; they cover the most popular kinds of vegetables used in every household and we are sure our customers will find them made up with the thought of being entirely practical. As these collections are put up previous to the busy season we cannot make any changes in the varieties or quantities. The collections named below if bought separately would cost considerably more.

For a succession, sow in drills in the open ground at intervals of two or three weeks, and thin out to 8 inches apart. For plants to force in hotbeds from November until spring, sow seed in hotbeds in the Where it is difficult to have the heading varieties develop properly on account of soil condition, we recommend the use of the loose leaf varieties.

**Kingsholm.** The largest and best heading variety of this type. the inner leaves blanch almost pure white and have little or no rib, the heads are very full throughout and therefore contain more edible part. Pkt., 10c.; 25c. per oz.; 1/4 lb., 80c.

After the second tier of leaves have formed, thin out to 4 plants in a hill. ### MICHELL'S SELECT ONION SEED

Ognon (Fr.); Zwiebel (Ger.); Cipolla (Ital.)

To grow full size onions, one ounce of seed will sow a 100 foot row; 5 to 6 pounds are required per acre. If it is desired to grow onion sets, sow 40 to 50 pounds per acre.

Sow in the early spring in rows 2 feet or less apart, according to cultivation method employed. The seed should be firmed in the soil. If it is desired to grow full size onions the first year, thin out when 3 inches high, so that they stand about 2 or 3 inches apart. White onions are mildest in flavor and are recommended for early use. The yellow sorts are best for winter keeping.

Ailsa Craig. The largest of all onions, often weighing 3 lbs. and over, each. Globe-shaped, slightly pointed at top and base; color a beautiful straw yellow. To obtain best results sow seed in hotbed and later transplant where they are to grow; in planting place 4 to 6 inches apart and thus procure gigantic specimens. Pkt., 10c.; 30c. per oz.; ½ lb., 95c.; \$3.50 per lb.

Bermuda White. Although known as the Bermuda White it is a light yellow or straw color; early and if transplanted about 4 inches apart, will produce immense flat bulbs. In the raw state it is very mild, while when cooked, the flesh is tender and of a delicious flavor; an elegant variety for slicing. Pkt., 10c.; 25c. per ½ oz.; oz., 40c.; \$1.25 per ½ lb.

Large Red Wethersfield. A flat, large growing variety; an excellent winter keeper; flavor much like the yellow sorts; full-size onions can be grown in one season. Pkt., 10c.; 25c. per oz.; ½ lb., 70c.; \$2.50 per lb.

Prizetaker. A mammoth yellow variety; if sown thinly it produces full-size onions in one season from seed, rivaling with the Bermuda varieties for size and flavor, often weighing 3 lbs. or more each. Pkt., 10c.; 30c. per oz.; 1/4 lb., 90c.; \$3.25 per lb.

Southport White Globe. A beautiful type of an almost round onion, growing to an enormous size. The flesh when cooked is of a rich milky color, of tender and delicious flavor and in the raw state it is one of the mildest. Pkt., 10c.; 30c. per oz.; 1/4 lb., 95c.; \$3.50 per lb.

Southport Yellow Globe. Similar to the Danvers except larger in size, more like the Prizetaker. This is probably one of the most uniform growing varieties, every bulb being almost perfectly round and of the same size; light straw colored skin. Pkt., 10c.; 25c. per oz.; ¼ lb., 75c.; \$2.75 per lb.

White Barletta. An extra early small round variety, used principally for pickling, also for bunching. Pkt., 10c.; 30c. per oz.; ½ lb., 90c.; \$3.25 per lb.

White Portugal or Silver Skin. The standard white onion for market or home use; mild flavor; semi-globe shaped and very uniform in growth and size. Pkt., 10c.; 30c. per oz.; 1/4 lb., 90c.; \$3.25 per lb.

Yellow Globe Danvers. This almost round-shaped onion is extensively sown by the private and market gardener on account of its good keeping qualities. It is a dark straw color and always produces a good crop, growing to a large size. Pkt., 10c.; 25c. per oz.; ½ lb., 75c.; \$2.75 per lb.

Yellow Strasburg. A dark straw color skinned sort; almost flat in shape, but a large onion. Its fine keeping qualities is what recommends itself to the home, as well as the market gardener. For a yellow sort it is rather mildly flavored; for growing sets, more of this variety is sold than any other. Pkt., 10c.; 25c. per oz.; ½ lb., 70c.; \$2.50 per lb.

Onion, Prizetaker

#### **ONION SETS**

One quart will plant a row about 50 feet.

Plant as soon as the ground can be worked. Press the bulb in the ground lightly (do not cover), in rows 12 inches apart, 2 inches apart in the row; so that all the development goes in the onion, on signs of their going to seed, bend the top over, but do not break it off. The advantage in planting onion sets lies in the fact that the young onion is ready often 5 weeks from the time of planting, while those grown from seed cannot be used until well in the autumn.

Shipped on Local Orders about March 10, unless otherwise requested.

If Onion Sets are wanted by parcel post, add 5c. per pt.; 10c. per qt.; 15c. per 4 qts.; 25c. per peck for postage.

Oseille (Fr.); Sauerampfer (Ger.); Acetosa (Ital.)

Broad Leaved French. Relished principally by the French people, who use it as a spinach dressing, also as a salad; has an acid flavor. Sow seed in the spring in good light soil in shallow drills 1 foot apart; thin out to 4 inches apart in the row. The seed stalks should be cut off when they appear. Pkt., 10c.; 30c. per oz.; ½ lb., 85c.

#### **SPINACH**

Epinard (Fr.); Spinat (Ger.); Spinaccio (Ital.)

One ounce will sow a row about 75 feet long; 10 to 12 pounds are required for an acre.

Sow for spring use, in drills one foot apart (covering the seed about one-half inch) as early as the ground can be worked and continue to sow every two weeks till May 15th. Spinach seed seldom germinates during June, July or August, so we do not recommend sowing again until September, which is the season to provide an early winter and spring crop. On the approach of cold weather cover with long manure, straw or other litter. Spinach can also be grown successfully under hotbed sash.

Spinach, Bloomsdale Long Standing Savoy

Bloomsdale Long Standing Savoy. The long standing characteristics of this variety make it valuable for spring sowing; it will stand considerable heat before bolting to seed, the leaves are thick, crimped and fleshy. 10c. per oz.; 1/4 lb., 20c.; 50c. per lb.; 5 lbs., \$2.25; \$4.00 per 10 lbs.

Long Season. Large plants and leaves, which are strong, robust and crinkled; will resist a great deal of heat without shooting to seed. 10c. per oz.; ½ lb., 20c.; 50c. per lb.; 5 lbs. for \$2.25; \$4.00 per 10 lbs.

Market Gardeners. This variety is the highest perfection of the Spinach family, a decided improvement on all other kinds. Leaves broad, heavy and of a dark green, glossy color, heavily blistered; will stand a week or ten days longer without shooting to seed, than any variety we know of. 10c. per oz.; ¼ lb., 25c.; 65c. per lb.; 5 lbs., \$3.00; \$5.50 per 10 lbs.

New Zealand. This variety endures heat and drought; excellent

New Zealand. This variety endures heat and drought; excellent for summer use; leaves small and thick. Heavy yielder, growing upright; one sowing can be picked from throughout the entire summer. A very distinct variety. In order to get a successful germination of seed, it should be soaked in warm water for about 12 hours before sowing. Do not confuse this variety with other sorts, as the seed should be sown about May 15th. Pkt., 10c.; 15c. per oz.; ¼ lb., 35c.; \$1.10 per lb.

#### RUTA BAGA

Ruta Bagas should be sown in drills about 30 inches apart and when 3 inches high thinned out to get the greatest root development. They need when about 6 inches high. They need to be cultivated liberally and hilled up

Customers frequently complain that Ruta Bagas grow too long in shape, rather than in a round form. Careful inquiry has developed the fact that this is caused by sowing the seed too early.

In the locality of Philadelphia and New York the seed should be sown from July 15th to August 1st. Seed sown earlier than this invariably produces the long shaped roots with long stems.

Purple Top Yellow. This is the perfect ideal Ruta Baga. Top is purple, the bottom yellow. It brings a high price when sold in the market on account of its shape. Pkt., 10c.; 15c. per oz.; ½ lb., 35c.; \$1.10 per lb.; 5 lbs., \$5.25.

#### SEEDS OF CULINARY AND MEDICINAL HERBS

There is an increasing interest in herbs today and Herb Gardens are becoming quite popular; the majority of them are very easy to grow and therefore should be grown more extensively than they are.

For Winter use, they should be cut just as they come into flower, tied in bunches and hung in a light, airy place indoors, where they can be available any time.

#### SPECIAL NOTICE

We regret that it is not practicable to ship Pot Grown Plants of Cauliflower, Pepper, Parsley, Egg Plants and Tomatoes via Parcel Post.

The foliage of these plants is very soft and tender and from experience (largely because of delays in the mail service) they reach their destination in a worthless condition.

Nor can we ship any of the above-mentioned plants outside the Beetle zone.

#### **CERESAN**

#### for seed treatment of small grains

Ceresan has proven effective in controlling such seed-borne diseases as bunt or stinking smut of wheat; stripe disease of barley; loose and covered smuts of barley and oats and covered kernel smut of sorghum. It is the only dust treatment which has successfully controlled these destructive grain diseases. Ceresan does not injure the seed nor the grain drill. Only 2 oz. of Ceresan required per bushel of wheat, rye or sorghum, and 3 oz. for barley and oats. Easy to apply, economical to use.

By controlling these diseases, germination is generally increased, stand improved and the resultant crop bigger and of better quality. One pound treats 16 to 20 bushels of seed.

Semesan may be applied in dust or liquid form to the seed before planting. It is harmless to the seed but deadly to disease organisms that may be on the seed. Semesan is such a powerful and effective disinfectant that seed treatment with it is ridiculously low in cost, ranging from 1/4c. to 1c. per pound of seed. One ounce treats 15 lbs. of seed. Effective in controlling damping off and such devastating gladiolus diseases as hard rot and scab. Also the most effective means of controlling "Brown Patch" which attacks the turf of golf courses, tennis courts and lawns.

#### ANSUL FORMALDEHYDE DUST

For Controlling "Damping Off" of Flower and Vegetable Seedlings; also for dusting Potatoes and any grain seeds before planting

Treatment is safe, economical and easy to apply No steam sterilization or seed treatment is necessary.

Ansul Formaldehyde Dust is a seed and soil treating compound which controls seed borne diseases and when applied to the soil controls "damping off" and other root rots of vegetable and floral seedlings. The sterilization of soil and seed with Formaldehyde is not new, in fact, it is one of the oldest disinfectants known. However, it is not easy to apply in the liquid form and too, the method of treatment does not fit into the growers program. The wetting of the soil and the long wait are undesirable. The Ansul Formaldehyde Dust treatment, the mixing of the soil and the planting of the seed is all one operation. It is also excellent for dusting potatoes and any grain seeds before planting to help control fungus diseases.

### MICHELL'S SELECTED HAND PICKED FIELD CORN

# Plant 8 to 10 qts. per acre in hills for shelled corn or for silo, or sow $1\frac{1}{2}$ to 2 bushels broadcast for fodder.

Our strains of corn are not the common kinds usually found in abundance on the market; we give very careful attention to selected stock, in all lines of farm seeds. This is particularly true of field corn where re-selection means the limit of crop with little or no increase in cost. Our stock is selected for size of ear and fodder, uniformity of kernel and the careful finish of the tip and butt, all of which means a considerable increase in production.

Champion White Pearl. An immense yielder, maturing in about 115 days; kernels deep set and snowy white; the merits of this

corn are surprising.

Early Canada Flint (Eight Rowed). A medium broad grained variety, perfectly smooth on the end and very hard. Makes a desirable sort for late planting. The cobs are very thin when shelled; excellent for pigeon and poultry feed.

Golden Beauty. The broad, massive golden yellow dented grains are arranged very evenly on gigantic ears. Fodder is enormous, often growing 12 feet high; matures late, but yields wonderful crops; desirable for silo and ensilage purposes.

Improved Golden Dent. A high yielding variety of yellow dent noted for heavy production of both grain and silage. A hardy,

resistant corn, producing a good ear on every stalk, with few nubbins. Ears large, rows straight, butts and tips well filled. Grains square cut, moderate in depth, with uniform dimpled dent, easily distinguishing it from other varieties. Fodder heavy and leafy, 10 to 12 ft. tall; on fertile soil capable of yielding 90 bushels shelled corn or 20 tons silage per acre.

Lancaster County Sure Crop. One of the best all-around general purpose varieties and has proved to be a most reliable and profitable corn for either husking or ensilage purposes. Grows quite tall; a sure cropper, producing a big ear on every stalk, very few nubbins; will yield good crops on land that is not so fertile; ears long, cob thin; top of grain rich yellow, when shelled the grain has a reddish yellow cast; matures early; husks very easily.

Leaming Early Dent. Beautiful long ears of deep, uniform kernels. The cob when shelled is very small. The stalks grow about 7 feet high, very leafy, excellent for fodder and on the average will produce two ears to the stalk; ripens in 90 days and

occasionally crops 100 bushels to the acre.

Reid's Yellow Dent. A splendid late variety with an average record of 100 bushels per acre; small cob, deep bright yellow grain.

**Price** for any of the above varieties of Field Corn 20c. per qt. (by parcel post, 30c.); larger quantity, price on application.

#### BARLEY

The straw is good for green feed or when cured as hay. The grain in the hull is excellent poultry feed. If wanted for hay it should be cut while the grain-head is in a soft or milky condition. Sow broadcast  $1\frac{1}{2}$  to 2 bushels per acre from May 15th to July 1st. 48 lbs. per bushel. Makes an ideal nurse crop for spring sown Alfalfa, frequently yields 50 bushels per acre. 20c. per qt. (by parcel post, 30c.); larger quantity, price upon application.

BEANS, SOJA OR SOY

This valuable plant enriches the ground in which it is planted by the free nitrogen gathered from the air and which is deposited in the ground by the roots. Fodder is relished in either green or dry form by cattle. Sow 1½ bushels per acre alone, or ½ bushel Soja Beans with one bushel Cow Peas. Sow in drills 2½ feet apart, any time from the first to the last of May. If wanted for silo it will be ready for harvest about the first of September, when the pods will be well filled; yields as high as 20 tons of green food per acre. 60 lbs. per bushel.

Mammoth Yellow (Late). 20c. per qt. (by parcel post, 35c.).

**Mammoth Yellow** (Late). 20c. per qt. (by parcel post, 35c.). **Wilson** (Early). 20c. per qt. (by parcel post, 35c.); larger quantity,

price upon application.

#### STANLEY'S CROW REPELLENT

Protects your corn during the period when it is most easily damaged, by ridding your crop of Crows, Pheasants, Blackbirds and other corn pulling birds and animal pests; also protects seed from rotting in the ground; insures larger yields; is non-poisonous. Per ½ pt., 60c.; \$1.00 per pt.; qt., \$1.75. One pint is sufficient for two bushels of seed corn.

For Corn Planters, see page 136.

#### **BROOM CORN**

Sow in May, about ten pounds per acre, in drills 3 feet apart. Plants should be thinned out to stand 3 inches apart in the row. Evergreen. Produces extremely straight brush retaining its green color well after ripening, thus commanding the highest market prices. Yields 1000 lbs. of salable brush per acre. Bushel 50 lbs. 20c. per lb. (by parcel post, 30c.); larger quantity, price upon application.

#### BUCKWHEAT

Japanese. In the locality of Philadelphia this is sown any time from June 1st to July 15th, one bushel of 48 lbs. broadcast to the acre. Makes a very fine quality of flour and is also largely used for poultry food. Buckwheat frequently yields as much as 80 bushels to the acre. 15c. per qt. (by parcel post, 25c.); larger quantity, price upon application

#### CORN, WHITE KAFFIR (for Seed)

The grain is used for feeding poultry and the fodder for cattle. Grows from 4 to 6 feet high, the grain being produced on the top of stalk in the shape of a brush; frequently as many as four heads of grain will be found on a single stalk. It usually ripens after the first few frosts; produces enormous crops. Can be sown as late as July at the rate of 10 lbs. per acre in drills (Bu. 56 lbs.). 15c. per lb. (by parcel post, 25c.); larger quantity, price upon application.

Two bushel seamless sacks, used in shipping farm seeds, in one bushel lots and over, are charged for at 30c. each; returnable at price charged if in good condition and prepaid.

#### RECLEANED CLOVERS

Prices quoted are subject to market changes

Alfalfa or Lucerne (Medicago-Sativa). A valuable forage crop. Sow during May, August and September, for best results, although it can be sown at other times with a possible chance of doing well. Sow not less than ½ bushel (30 lbs.) per acre, preferably with no other crop. Our seed is always over 99 per cent pure, and will invariably give the best results. Our Special Instructions on growing Alfalfa is free for the asking. Choice Non-Irrigated Western Grown Seed. 35c. per lb. (by parcel post, 45c.).

Grimm Alfalfa. Claimed to be hardy in any and all regions; a

heavy yielder and of deep rooting ability. It requires about 15 to 20 lbs. of Grimm Alfalfa to properly seed an acre. 40c.

per lb. (by parcel post, 50c.).

Alsike or Swedish Clover (Trifolium Hybridum). One of the best for mixing with timothy; perfectly hardy in every climate or soil condition; grows from 1 to 2 feet high; sow early in the spring or late summer and early autumn, 10 to 15 lbs. per acre alone, or

8 lbs. per acre with Timothy. 35c. per lb. (by parcel post, 45c.). Bokhara or Sweet Clover (Melilotus Alba). While extensively used as a bee food, this is a valuable variety for soiling (green manure); for sowing in spring on lands which are later to be sown in Alfalfa, this is excellent. It grows from 3 to 5 feet high, according to soil and location; can be cut as often as three times in a season if wanted for forage. Sow 15 lbs. per acre in early spring, alone, or 10 lbs. per acre with other crops. We handle

only the true white flowering hardy variety. Choice Hulled Seed. 20c. per lb. (by parcel post, 30c.).

Crimson Clover (Trifolium Incarnatum). Used principally for soiling or green manuring. If desired for feed, cut it just before it flowers. When desired for green manure, it should be allowed to mature; its height is from 1 to 2 feet. Sow any time from April to October, the earlier the better, 20 lbs. to the acre. If sown in early spring it can be plowed down the first year. Late summer or fall seeding is usually practiced. It is not hardy for more than one season and must be sown each year. 20c. per

lb. (by parcel post, 30c.).

Mammoth Red Clover (Trifolium Pratense Perenne). Sometimes called Sapling or Pea Vine Clover and English Cow Grass. This differs from the "Medium," being of a ranker growth and yielding more fodder per acre. Sow in early spring or in July and August, using 20 lbs. per acre alone, or with other crops 10 lbs. per acre. It can be cut several times in a season. 35c. per lb. (by parcel post, 45c.). Red Clover, Medium (Trifolium Pratense). More widely known and used than any other; used principally for hay purposes. Height from 18 inches to 2½ feet. Sow early in the spring or in late summer—July and August; if alone, 20 lbs. per acre; if with other crops, 10 lbs. per acre. A red clover field can be cut twice a season. 30c. per lb. (by parcel post, 40c.).

White Dutch or Lawn Clover (Trifolium Repens). This is valuable for pasturage as well as for lawns; it succeeds where other clovers and grasses fail and it seldom dies out. It can be sown at all seasons, although early spring is best. Sow 10 to 12 lbs. per acre if alone, or 5 lbs. if sown on old turf or with other crops. Per oz., 10c.; 25c. per  $\frac{1}{4}$  lb.;  $\frac{1}{2}$  lb., 45c.; 85c. per lb. (by parcel post, 95c.); 5 lbs., \$4.00 (by parcel post, \$4.15); \$7.75 per 10 lbs. (by parcel post, \$8.00); per bu. of 60 lbs., \$45.00; \$75.00 per 100 lbs.

Prices on Clovers (excepting White Dutch), for quantities larger than 5 lbs., will be quoted on request.

#### CANADIAN FIELD PEAS

These are used for various purposes, chief among them being a very early green food; when used this way they are sown with oats about April 1st at the rate of  $1\frac{1}{2}$  bushels of Peas and  $1\frac{1}{2}$ bushels of Oats to the acre either drilled or broadcasted. They may be sown successively up to July if one has the available land. Peas may also be sown alone at the rate of 3 bushels per acre and furnishes excellent hay. The dried peas are extensively fed to pigeons while when ground as meal is an excellent addition to the regular soft food of cows, sheep and horses. 25c. per qt. (by parcel post, 40c.); larger quantity, price upon application.

#### **COW PEAS**

Cow peas are one of the best, largest yielding and most nutritious of the farm crops; they provide the most inexpensive methods of bringing soil back to a stage of fertility. They grow in the poorest kind of soil, leaving it very rich in ammonia. In the latitude of Philadelphia sow from May 1st to July 1st, two bushels per acre broadcast, or one bushel per acre in drills. For a large crop sow the seed as late as possible.

Black. One of the popular varieties extensively grown; very prolific and matures early. 20c. per qt. (by parcel post, 35c.);

larger quantity, price upon application.

Whippoorwill. Medium early; upright growing; a variety more extensively used than any other. 25c. per qt. (by parcel post, 40c.); larger quantity, price upon application.

#### **FLAX**

This is grown for the fibre from which linen thread is made and also for the seed from which that indispensable product, "Linseed Oil," is made. When ground it makes an excellent tonic when fed to horses, cattle and poultry. If grown to harvest seed, sow 1 bushel to the acre from May 15th to June 15th. If desired for the fibre, sow  $1\frac{1}{2}$  to 2 bushels per acre (56 lbs. per bushel). 20c. per lb. (by parcel post, 30c.); larger quantity, price upon application.

#### MILLET

Can be sown as late as July 15th and yield a tremendous crop. Also desirable for green manuring, when it should be turned under when about 10 inches high. Makes an excellent green food for stock. If used for hay it should be cut just as it matures.

If sown early in May it may be cut twice in one season. Sow 12 lbs. per acre, broadcast, any time from May 1st to June 15th. 15c. per lb. (by parcel post, 25c.); larger quantity, price upon application.

Tennessee Colden. This requires a longer season to mature than the other sorts; it produces a very fine quality of hay and makes a larger seed head. Sow 1 bu. (50 lbs.) broadcast to the acre, from April 10th to July 10th. 15c. per lb. (by parcel post, 25c.); larger quantity, price upon application.

Culture. Dahlias are at their best during the latter part of September or early in October. To get exhibition blooms, disbud plants up to August 1st. Spade or plow the soil 12 to 18 inches deep; fertilize with well-rotted stable manure or hyper-humus; scatter about ¼ lb. of bone meal around each hill when planting. If soil is very heavy, incorporate a liberal quantity of granulated peat moss. About August 1st, apply about ½ lb. bone meal to each plant and work in thoroughly; sheep manure or potato fertilizer can be substituted for bone meal at this time to good advantage.

HOW TO KEEP DAHLIA TUBERS AFTER THEY ARE SHIPPED TO YOU IF TOO EARLY TO PLANT

Open package and leave tubers in packing material you receive them in. Do not expose to air or moisten too much; keep in a cool place, but not where they will freeze.

Free on request, our booklet on the culture of Cannas, Dahlias and Gladiolus.

The dahlia as a cut flower enhances the beauty of any decoration you may make. It is a prolific bloomer, a single bush will produce blooms for many weeks. The best time to cut flowers is in the early morning; mature flowers should be selected, the stems cut slantwise with a sharp knife; the lower leaves should be stripped off and the ends of the stems either burned or dipped in boiling water for half a minute. The dahlias should then be placed in deep containers full of cold water and put in a cool place, free of drafts; if the end of stems have become dry they should be cut before placing in water.

#### POMPON VARIETIES

### MICHELL'S SUPERB GLADIOLUS

There is no other Summer flowering bulb that is enjoying so great popularity as that of the Gladiolus. Their adaptability to garden decoration or to use as cut flowers during the Summer and early Autumn is surpassed by no other flower. They are not only showy in the garden but when cut with the first flower open, will last for 10 days in the house. They thrive in almost any good garden soil but better results may be had if soil is well prepared and enriched with some of our pulverized manures. Great improvements have been made in the size, color and beauty of these flowers. Our list comprises the best of recent introductions as well as the most popular of the standard varieties. Plant bulbs 4 inches deep and from 4 to 6 inches apart.

When cutting Gladiolus for the house, they should be cut as soon as the first one or two lower flowers are open; the remainder will open. Remove the flowers as they fade, cut off a little of the stem and change the water every day; this will prolong the blooming period.

# MICHELL'S HARDY GARDEN LILIES

A garden is not complete without a planting of Hardy Lilies; they do exceedingly well in the herbaceous border; the varieties listed can be planted in the early spring months and it is recommended that they be planted among hardy perennials, as the shade from the surrounding plants is necessary for their welfare.

Cultural Directions.—All Hardy Lilies should be planted from 6 to 8 inches deep, the Japan varieties even 12 inches deep; the bulbs should be completely enveloped in sand, no manure should come in contact with the bulbs, but may be placed 4 to 6 inches underneath. All loose petaled bulbs should be planted on their side instead of upright. Cover with leaves or litter during winter. Our Bulb Growing Guide gives full instructions on the growing of Lilies; ask for free copy.

If Lily Bulbs are wanted by Parcel Post, add 25c. per doz. for postage.

# MICHELL'S SUPERB SUMMER-FLOWERING BULBS

Montbretias

### **MONTBRETIAS**

Montbretias resemble miniature gladiolus, are fine for cutting and excellent for border planting. They prefer a light, loamy soil, well enriched with leaf mould, but no manure or chemical fertilizer should touch the roots; a little bone meal and a light top dressing of lime should prove beneficial. They will thrive either in partial shade or full sunlight, but see that the moisture supply is good at all times.

## MICHELL'S RELIABLE PLANTS

## PLEASE READ CAREFULLY BEFORE ORDERING PLANTS FROM THIS CATALOG

So far as possible, when there are other goods on your order, please write the portion applying to plants on a separate sheet. Plant orders are filled and shipped at what we consider the proper season for planting, unless otherwise instructed by customers. Shipments for Southern States or localities, where cold weather is not a permanent thing, are made as soon as possible, unless otherwise instructed.

Shipments are best made by express, except orders for small plants or few in number. These can be sent via parcel post, if sufficient remittance on cash orders accompanies same.

In some cases the parcel post charges may be slightly in our favor, in the other instances they will be in favor of the buyer,

although our customers should not overlook that it requires expert packing for safe arrival of shipments via parcel post.

Please Note:—Orders for less than the number of Plants listed cannot be filled, except they are offered at our counter and are taken with. Prices are especially established for these.

## SHIPPING TIME

In average seasons, applying to orders booked for Spring.

Hedge, Small Fruits, Trees, Flowering and Ornamental Shrubs.—Sometimes late in March, generally during April and lasting until growth is too far advanced for transplanting with safety or assurance of stock surviving.

Herbaceous Perennials.—April and continuing until either stock is exhausted or until season is too far advanced. Most perennials are pot-grown and can be planted safely at any season, as long as they are procurable.

Roses.—May is the best month for these, unless April is warm and settled.

Bedding Plants.—Geraniums, Cannas, Salvia, etc., are usually shipped beginning May 10th.

### SPECIAL CAUTION

NOTICE—On receiving Plants, unpack them, plant and water thoroughly immediately. If they cannot be planted at once, at least unpack and water them. Newly planted stock, no matter how moist it may appear, should at planting time and every day (in the evening) for a week thereafter, be watered thoroughly, unless we have rain each day during the period. Most losses through Plants, Shrubs, Trees, Hedges, etc., dying, are caused by their not being watered sufficiently and regularly at planting time.

## SPECIAL NOTICE ON GUARANTEE

We spare no effort to supply all Plants, Trees, etc., of the best quality in first-class living condition. On account of the many causes beyond our control, we regret we cannot guarantee this stock to live and establish itself, as that is entirely within the power of the buyer or planter.

## Ready for shipment about May 1st

The Roses we are offering are all strong 2-year field grown plants that were dug last Fall and potted into 6-inch pots. Roses thrive best in an open sunny position and they should be planted away from all trees and shrubs so that the roots will have the full benefit of the nourishment in the soil. Roses are gross feeders and consequently require a rich soil. Select a well drained position where the soil is good and dig in a liberal amount of well decomposed stable manure thoroughly mixing it with the soil. For best results the beds should be made from 4 to 5 feet wide, planting the Hybrid Teas 18 inches apart and the stronger growing Hybrid Perpetuals 2 feet apart, planting all about 8 inches or 10 inches from the edge of the beds. The pot grown plants we send out have already been pruned and arrive with a ball of earth around the roots, this ball should not be disturbed but should be thoroughly wet when planted. Budded Roses should be planted so that the bud is about 2 inches below the surface of the ground; firm the soil well around the roots and give a thorough watering. Throughout the Summer, the surface of the bed should be frequently cultivated, or a good mulch of our granulated Peat Moss will be found very beneficial, as it not only keeps the ground cool and moist but it prevents the growth of weeds. The best method of protecting Roses for the Winter in this locality is to draw up a mound of soil around the base of the plant to a height of 8 to 10 inches, thereby protecting the buds at the base of the plants from the alternate freezing and thawing, which is so injurious. When Roses are growing freely they are less liable to insect pests or fungous diseases than if they are starved or otherwise neglected. A weekly application of Aphistrogen or Fungtrogen and Insectrogen will keep the plants free of most all insect pests and mildew as they will be found offered on page 179.

Climbing Hybrid Tea Rose, Lady Ashtown

### HARDY HYBRID PERPETUAL ROSES

Before the development of the Hybrid Teas, this was the most popular type for garden planting and even now they should not be overlooked, but should be used extensively in conjunction with the other sorts. They are perfectly hardy and of vigorous growth, blooming tremendously in June and sometimes sparingly in Autumn. Hybrid Perpetuals are taller in growth and need more space than the Hybrid Teas; in pruning cut away all weak growth, and if quality of bloom is desired, cut back the strong canes to within 8 or 9 inches of the ground, but if quantity of bloom for garden effect is desired, leave these canes from 2 to 3 feet high, according to their strength.

American Beauty. Very large flowers, deep pink to carminecerise, delicately veined with darker red. A strong grower and deliciously fragrant. 75c. each.

Frau Karl Druschki. This is the queen of all white roses both in size and purity. The flower is very double and opens to a pure snow white. The growth is vigorous and the plant is a most prolific bloomer during the month of June. Scattering flowers often appear in the Fall. 75c. each.

## HARDY CLIMBING AND RAMBLER ROSES

As an ornamental plant for covering verandas, porches, side walls, pillars, fences, etc., these are unequalled, calling forth more admiration than anything else that can be used. They require no pruning in the Spring beyond the cutting out of very old or dead wood and shortening of the laterals and long canes to make the growth conform to the space to be covered, but a severe pruning in July directly after they have finished flowering is beneficial. Cutting away at that time all old flowering wood will encourage a vigorous growth which will give an abundance of flowers the following season.

Albertine. A most pleasing shade of cameo-pink with salmon suffusion; moderately double, sweetly scented flowers, produced early in the season; healthy glossy foliage. 75c. each.

Alida Lovett. An extra strong sort, producing bright, shell-pink flowers, tinted yellow at the base and of Hybrid Tea shape and size. 75c. each.

American Pillar. The large single flowers are a lovely shade of cherry pink, with a clear white eye surrounding numerous golden yellow stamens. 75c. each.

Bess Lovett. Resembles Climbing American Beauty in shape of flowers but much brighter in color, being a clear bright red, double, full cupped form and of notable lasting quality. 75c. each.

Chaplin's Pink Climber. A striking novelty, similar in size and form to Paul's Scarlet Climber but in color a rich lively pink. We believe this to be one of the best climbing Roses to date. 75c. each.

Christine Wright. A beautiful rose of strong climbing habit, producing double flowers 3 to 4 inches in diameter, singly and in clusters, of a wild rose pink. 75c. each.

Climbing American Beauty. The name of this rose is rather misleading, yet on its own merits it is a splendid climber. It has but one blooming season, June, when it bears abundantly, bright self-colored, medium pink flowers of moderate size. 75c. each.

**Dr. W. Van Fleet.** One of the most important climbing roses, having perfectly formed buds, long pointed, flesh pink in color and very solid. The full bloom flowers are very large, borne on long stems, fragrant and fine for cutting. 75c. each.

Dorothy Perkins. Beautiful shell pink, fragrant and full, blooming in clusters in June. The most popular of all climbing roses during the past few years. This is a very good rose for covering stone walls, fences, embankments and arbors. 75c. each.

Emily Gray. A real yellow climbing rose, producing long pointed buds opening to large orange-yellow flowers with stems long enough for cutting. These stems are crimson-red in color, contrasting beautifully with the dark green, glossy, holly-like foliage. 75c. each.

Excelsa. Here we have a worthy successor to Crimson Rambler, being equally as free flowering as that variety but without its unsatisfactory foliage. Really the best double red rambler. 75c. each.

Gardenia. Buds bright yellow, opening to double flowers of cream color; incurves towards evening to the shape and color of a Cape Jessamine, hence its name. 75c. each.

Jacotte. A wonderful new yellow climbing rose with bright glossy green foliage and sweet scented orange-yellow flowers. 75c. each.

Mme. Gregoire Staechelin. The new climbing Rose from Spain; gorgeously colored and exquisitely perfumed; its color is iridescent, pearl-pink with claret-carmine markings on the outer petals. Perfectly hardy, and has large disease-resistant foliage. \$1.00 each.

Mary Wallace. Long pointed buds and very large, cupped semi-double flowers, clear rose-pink in color. A strong grower and very free flowering. 75c. each.

Paul's Scarlet Climber. No other rose in any class can compare with it for brilliancy of color, which is a vivid scarlet that is maintained without burning or bleaching until the petals fall. 75c. each.

Primrose. A real hardy yellow rambler, in color a light primrose-yellow, holding this color until the petals drop. The flowers are about  $2\frac{1}{2}$  inches in diameter and are borne in trusses of from two to five on long stems. 75c. each.

An Arch of Climbing Roses

Silver Moon. An indispensable hardy climber, having long well shaped buds, creamy yellow on first appearance, opening into immense Clematis-like flowers of a waxy whiteness. The center is a mass of bright yellow stamens, making a wonderful contrast. 75c. each.

**Tausendschoen.** The individual flowers are of a most elegant and graceful form. In color it is a most delicate shade of soft pink when first opening, changing to carmine on the reverse of the petals when fully expanded. The flowers are produced in trusses, each truss almost a bouquet in itself. 75c. each.

White Dorothy. A handsome pure white sport from the old favorite Dorothy Perkins, and it has all of the finer qualities found in that charming variety. 75c. each.

The New Dawn. (The Everblooming Dr. Van Fleet). A sport from Dr. Van Fleet which is acknowledged to be the best and most popular American Climbing Rose. This new variety is identical in every way with the parent in size, formation of flowers and color, but flowers continuously during the entire season. Strong two-year-old plants, \$1.50 each.

The New Hardy Everblooming Scarlet Climbing Rose, Blaze. U. S. Plant Patent No. 10. A marvelous new hardy climbing Rose which inherits the blazing color of Paul's Scarlet Climber and the everblooming habit of Gruss an Teplitz, thus combining the most attractive features of both of its parents.

It is a very vigorous grower and will produce flowers on both the old and new growth. A Rose that will become very popular. Strong two-year-old plants, \$2.00 each.

## ROSA HUGONIS (Golden Rose of China)

This Chinese native is a notable contribution to American gardens. Every branch of the previous year's growth is, in late April or early May, closely set on both sides to the very tip with exquisitely beautiful, single, clear yellow flowers. The long, arching sprays make Hugonis not only a beautiful shrub, to be planted, if one so prefers, with other shrubs, but when cut are charming as table decoration.

charming as table decoration.

This "Golden Rose of China" is ruggedly hardy everywhere in America. It needs neither protection nor pruning, save in the occasional cutting out of the older shoots. Do not plant it among Roses as it is too vigorous in growth to fit in

such a planting. 75c. each.

All of the old-fashioned flowers which were the delight of our grandmothers are to be found in this class of plants. They are all perfectly hardy and die down in the Fall, appearing again in the Spring with renewed vigor.

There is an ever increasing demand for hardy perennial plants, as they are of easy culture and there is not a time during the whole season when some are not in bloom. Each variety has a fixed time for flowering so that by making a judicious selection a succession of bloom may be had from early Spring until late Autumn. There is no set rule for the planting of perennials. The amount of room at one's disposal, the location and also the individual taste of the planter must be taken into consideration. Probably the most satisfactory results are obtained from a hardy border backed by a hedge or a fence, planting some of the taller growing sorts such as Hollyhocks, Hardy Asters, Bocconias, Helianthus and Boltonias in the back, graduating the shorter growing sorts toward the front and finishing the border with an edging of Plumbago Larpentae, Phlox Subulata, Arabis and other of the dwarf growers.

Our booklet, "The Hardy Flower Garden," is an instructive publication and will be sent free on request.

## HARDY GARDEN CHRYSANTHEMUMS

These showy and effective favorites are now universally popular. When planted outside they extend the flowering season of your perennial garden, blooming profusely in October after other flowers have been browned by early frosts, which do not affect the Chrysanthemums, producing a wealth of bloom especially fine for cutting. They should be planted in a well drained position either in the hardy border or at the edge of a shrubbery border. The planting should be done early in the Spring, so that the plants will have the entire Summer to establish themselves, and late in the Autumn, after they have finished flowering, and the tops have been cut off they should have a covering of leaves or loose litter as a Winter protection, but do not cover with manure. Early in the Spring after danger of severe freezing is over and before any growth starts, the covering should be removed.

### TREE PEONIES

Tree Peonies are similar to other Peonies, except that blooms are more vivid in color, usually much larger and in many varieties the flowers are beautifully crinkled like crepe paper. They bloom from two to three weeks earlier than other Peonies. The plants do not resemble those of other Peonies but are finer rooted and woody branched, like shrubs, hence their name, "Tree Peonies." The branch tips die back slightly in Winter, but the plants gradually grow into bushes from 3 to 5 feet in height. Freezing of branch tips in no way injures or interferes with bloom, for new shoots sprout rapidly in the Spring, frequently from the roots and produce flowers immediately. Mature plants produce scores and even hundreds of blooms.

Culture.—Tree Peonies are scarce because it is difficult to propagate them, but once established, they are as hardy as Lilacs. During the first Winter after planting, a mulch of clean straw or hay should be placed around them, 4 to 5 inches deep, after the ground is frozen, this prevents heaving in the Spring. South and East exposures (in front of walls, foundations, hedges, etc.) are preferred locations in severe climates. An ideal location is where they are protected from direct rays of morning sun and extreme heat of afternoon sun. Any good garden soil will do, feed with bonemeal or other good fertilizer but do not use stable manure, keep well cultivated and watered. Plant one inch deeper than they were in the Nursery row. Since they bloom in early Spring the plants, when in bud, should be covered at night in case of late frosts.

Moutan (The Wild Tree Peony of Thibet). The earliest, most free blooming and vigorous of all. Large, single, flaming scarlet-red blooms with golden stamens and crinkled overlapping petals. 10 to 15 inch well branched plants, \$4.00 each.

Mixed. We have a nice lot of 8 to 10 inch 2-year-old plants, grown from a famous collection, which we offer in mixed colors only, at \$4.00 each.

## MICHELL'S GIANT FLOWERING PEONIES

Next to Roses these are the most popular June flowers, and justly so, for they lend themselves to almost any style of planting, while for the little care required they give a variety of color and wealth of bloom unequalled by any other plant. Their requirements are few; they will succeed in any good garden soil in an open sunny position. Care should be taken, however, to keep all fresh manure away from the roots—if barnyard manure is used it must be thoroughly decomposed—if you are unable to procure this, Bone Meal makes a good fertilizer. Peonies may be planted any time after September 1st until the ground freezes in the Autumn, and in the early Spring until the season is too far advanced; the best time, however, is during September and October, as they make roots during the moist cool weather of the Autumn and consequently carry through the Winter in better shape. The roots should be set so that the top or upper eyes are about two or not more than three inches below the level of the soil; do not set the roots flat, but stand them up. For the best results Peonies should be planted from three to four feet apart each way, according to the space at your disposal; the ground them should be well cultivated at all times and in the Spring after growth starts they should have an abundance of water if the season is at all dry. When cutting the flowers always leave one or two bottom leaves; it is best to leave a few flowers on the plant also, as it is of vital importance that sufficient foliage be left to develop the eyes under the ground for next season's growth. Newly planted roots may not develop a characteristic flower the first season, in fact it is usually not until the third year that perfect flowers true to description will be produced. Peonies are seldom troubled with any disease or insect pests; ants sometimes appear on the buds coming to gather a sweet gum which the bud exudes while developing; they will do no harm and will disappear when the flower opens.

Rock gardens are yearly increasing in popularity, as rockery building is a fascinating pastime and if one has only a few square yards of ground this will be found sufficient to grow quite a variety of plants, affording a great deal of pleasure in caring for them and watching the rockery develop.

One of the most interesting points of the rockery or rock garden is that each of us may build it according to our own ideas, pro-

viding it is correctly built as to drainage and the proper placing of the rocks in order to keep the soil in place.

The rock garden may be of any size from an unpretentious mound of soil with rocks cropping out here and there, to a miniature mountain range or a rock strewn valley with a small stream running through the center. Before building the rock garden, the location should be selected in an open sunny place or one in partial shade, according to the variety of plants desired; some do best in full sunlight while others require some shade. In either location the ground must be well drained.

The next step is to plan the rockery as to size and shape. Do not use too much stone, too little is better than too much, and use stones of a good size; small stones are of no use except for filling in or drainage. Place the stones so that they will keep the soil

from washing when watering or during heavy rains.

Place the plants in the pockets of soil or in the open spaces between the rocks. Be sure, however, that the soil is firm around the roots of the plants.

Below will be found a list of plants we offer suitable for rock garden planting.

Clematis Henryi

Ampelopsis Veitchii

#### **CLEMATIS**

This family of Climbing Plants are probably more popular than any other. Some of the small flowering varieties are exceedingly fragrant. The large flowering types make a glorious effect on account of their gigantic blooms and striking appearance. All Clematis delight in plenty of sunlight, rich soil and plenty of water in dry weather. Great care should be exercised in planting the large-flowering varieties. During the process of transplanting, the stem is likely to get broken below the eye shoots, which would render the plant useless. To guard against this, place a few stakes around the plant to protect it after planting. In the winter put a covering of straw, long manure, or leaves around the roots.

A planting of Shrubs massed around the boundaries of a garden forms a harmonious background against which the bright colored Peonies, Poppies, Iris, Phlox and other Hardy Perennial Plants appear to their best advantage.

Because of their easy culture, rapid growth, adaptability to most any situation and their great diversity in size, foliage and bloom, the shrubs are of first importance in creating landscape beauty. There are many suitable locations for planting shrubs about the home grounds. The house foundation and the angles and corners should be softened by shrubs of medium height. Spiraeas, Hydrangeas, Berberis, Deutzias and others of a like nature are suitable for this purpose.

Taller shrubs such as Lilacs, Philadelphus and Altheas are better planted along the sides and rear of the grounds. Here they can be used to give a frame to the property, block out undesirable views and serve as a screen for any purpose desired. Such group plantings should be made in the nature of borders, and the shrubs selected and arranged to give a continuance of bloom, pleasing foliage combinations together with a Fall and Winter coloring of bark and berries.

In planting, space the larger growing shrubs, such as Lilacs from four to five feet apart; medium tall shrubs, such as Spiraea Prunifolia three to four feet apart, and dwarf growing sorts such as Berberis or Deutzia Gracilis, two to two and one-half feet apart. Dig holes of ample size, place the plant, and after filling in with two-thirds of good top soil, add water to the level of the ground and allow this to settle. After the water has passed away, complete the filling in of the soil.

In pruning, remember that all early flowering shrubs bloom on the last year's wood and should not be pruned until after they have bloomed (otherwise the blooms will be destroyed for that season), at which time the old worn out wood and all weak growth should be cut away, allowing the vigorous young shoots to remain. The late flowering Shrubs, such as Altheas, Hydrangeas, etc., bloom on the wood made this season. These should be pruned early in the Spring, cutting them back severely to induce a vigorous new growth.

BUDDLEIA-Variabilis Magnifica (Butterfly Bush or Summer Lilac).

This is perhaps the most popular of our garden and hardy border shrubs, being almost continually in flower from July until frost. The bush grows to a height of about four feet and produces an abundance of flower spikes, which are made up of myriads of miniature florets of a beautiful lilac shade. The flowers are very fragrant and attract butterflies in great numbers, from which fact the shrub has gained its name. Even a small plant will flower freely the first season, if planted early.

Late in Fall a mound of earth should be drawn up around the base of the plant to a height of 10 to 12 inches as a protection to the eyes at the base of the stem, which will produce the growth the next season. Early in the Spring the mound of earth should be removed and the entire plant should be cut down to within 6 inches of the ground. Strong plants that will bloom the first season. 3 for \$1.00 (by P. ## NEW RED-LEAVED JAPANESE BARBERRY

It is similar in all respects to the green-leaved Japanese Barberry which is so popular for mixing in the shrubbery border, as single specimens, or for planting in clumps on the lawn, as well as for toundation planting and for hedges, but the foliage of this new variety is of a rich, lustrous, bronzy red, similar to the richest red-leaved Japanese Maples. As the season advances, this new Barberry becomes more brilliant and gorgeous throughout the summer, and in the fall its foliage changes to vivid orange, scarlet, and red shades, more brilliant and more effective than in the ordinary Japanese Barberry. In this coloring it is unequaled by any other shrub and is followed by the same brilliant scarlet berries common to the type, which remain on the plant the entire winter.

All that is required to develop its brilliant coloring at all seasons is that it be planted in full exposure to the sun.

#### BERBERIS THUNBERGII (Japanese Barberry)

A good hardy plant of low dense growth. There is an air of grace and refinement to the Barberry Bush which is not embodied in any other hedge plant. It is a brilliant light green from early spring to winter, it should be regarded as a shrub as it can be planted individually in lawn or border. The slender branches are prickly, with small thorns, and tend to make a defensive hedge that few animals will attempt to penetrate. In autumn the foliage is a bright crimson; when it falls a profusion of scarlet berries, which remain throughout the winter, are revealed on the branches.

# THE"OUT-U-KUM" WEED PULLER

An Entirely New Principle

A slight Push and Pull thoroughly loosens the surrounding soil and removes not only the weed, but the entire root.

When pushed into the ground, the two points guide the BRIDGE down alongside the weed, loosening the soil from that side. It then crosses under the root disengaging the latter. As the tool is withdrawn the BRIDGE slips up the opposite side of the weed, loosening the ground from that side and engages the head of the weed above the ground. The now thoroughly loosened weed is readily withdrawn in its entirety with little or no clinging soil.

Price of the Out-U-Kum Weed Puller 75c. each (by P. P., 85c.).

### MICHELL'S HIGH GRADE LAWN MOWERS

## MICHELL'S IMPROVED HIGH WHEEL BALL-BEARING

We have had designed by the best lawn mower makers in the United States the "Michell" High Wheel Ball-Bearing Mower. Of the best material throughout in every detail, there has been the thought to construct not only a mower that would appeal to the intending purchaser from a standpoint of looks, but to give him more for his money than we might be able to do in other makes. The "Michell Ball-Bearing High Wheel Lawn Mower" is made for us by Pennsylvania Lawn Mower Works, who are the originators and makers of the "Famous Pennsylvania Quality" machines.

It has a 5-blade cylinder of tool steel blades, each hardened and tempered in oil; equipped with internal driving gears on both sides. The cones and cups in which the balls revolve are hardened tool steel, while the balls themselves are extra large, of the best quality. The drive wheels are 10 inches high, which ensures easy running; the bottom knife is self-sharpening with raised edge, of crucible steel, that will ensure long service. Can be regulated to cut grass at a height of from  $\frac{1}{2}$  to  $1\frac{1}{2}$  inches, by adjustment, while it mows grass with ease that is 6 inches high.

# THE NEW 1933 MODEL SOL-HOT BROODER

Sol-Hot is the only brooder on the market that has a different size burner for each size canopy. It costs more to build them this way, but it means economy for you.

# You take no risk when you order a Sol-Hot

If you are thinking of buying a brooder this season, by all means buy a Sol-Hot—it means so much to you in the way of saving of labor and better results in the rearing of your chicks.

You may be able to buy a brooder that costs a little less money, but based on the better value you get—the more chicks you will raise—the freedom from trouble—the elimination of fire hazard—Sol-Hot is by far the cheapest brooder in the long run.

# It's the Twin Float Automatic Oil Level Control

Sol-Hot, with its many years of undisputed leadership, once more steps "Way out in front" this season with the greatest invention ever made for oil-burning Brooders. The patented TWIN-FLOAT Oil Level entirely eliminates the trouble and bother of having to level up the brooder in order to get it to burn properly. Equipped with the New Twin-Float Oil Level, the Sol-Hot Brooder can be set anywhere, regardless of uneven floor conditions. Comes assembled, ready for immediate operation. No leveling of any kind needed.

# 100 Per Cent Safe

No danger from fire—no trouble—no worry. All you have to do is to put oil in container, prime and light the burner, and turn flame control valve—like knob on gas stove—to height desired. The oil container is connected to the burner with copper tubing. It can be set anywhere, on the floor, on a shelf, high or low—it makes no difference. Burner cannot overflow—cannot go out—the Twin-Float absolutely prevents it. Operating a Sol-Hot is as simple as using a gas stove.

# OLEATE COATED ARSENATE OF LEAD

Kills Japanese Beetles

Spray early, when the first Beetles are seen. Kills Japanese Beetles and protects the foliage. The dead Beetles are not seen as they go into the soil to die, but it is estimated that 80% of those that start feeding on foliage sprayed with this material are killed. It has such great sticking qualities that one thorough spraying will be sufficient for protection during the Beetle season. Every particle is covered by an Oleate Soap, which makes it palatable to the Beetle. Foliage which has been thoroughly sprayed is never seriously injured by Beetle feeding. A one pound jar will make 10 gallons of spray.

# ANTS DESTROYED

New Method "Gets"
Them at Their Source—
Safe, Permanent, Effective

The Antrol system is adapted to any size house or garden and quickly destroys all species of sweet eating ants. It is composed of small glass containers and a special formula of syrup. The containers are partially filled with syrup and placed about the outside edges of the house or along "ant" trails in the garden if the infestation occurs there. The ants smell the syrup, eat it and then transmit its mild poison to the queen in the nest. Soon the entire ant colony is destroyed!

The complete system should cover every 15 feet around the outside of the house or "ant" trails in the garden. Once installed permanent, effective and safe protection is insured from these annoying pests.

# Make Your Lawn and Garden Grow!

# Feed Your Plants With

# WIZARD BRAND MANURES

It is easy to make all plants grow if you will provide them with a rich fertile soil. Wizard Brand Manures are Nature's perfect plant foods. They are lasting soil builders and not temporary stimulants. They supply all the necessary plant food elements and in addition furnish the humus not found in chemical fertilizers. These natural plant foods are economical, safe and easy to use. Use Wizard Sheep and Cow Manures on your lawn, garden, shrubs, trees and vegetables. You'll be amazed at the new growth and beauty that Wizard brings.

Wizard Sheep Manure is a highly concentrated pure sheep manure dried and sterilized to kill all weed seeds. It is Nature's way of building up soils and making plants grow. Wizard will not burn lawns or plants. It is most economical because ONE BAG EQUALS A WHOLE WAGON LOAD OF STABLE MANURE.

LAWNS AND GARDENS. Wizard produces thick, velvety, green lawns of lasting beauty. Make an application early in Spring and you will be surprised at the new beauty it will develop. On old lawns broadcast, like sowing seed, 6 to 10 lbs. per 100 sq. ft., on new lawns 10 lbs. per 100 sq. ft. raked into the surface soil. Luxurious green foliage and a wealth of vivid colored flowers quickly follow the use of Wizard. Mix well with the soil under new plantings and cultivate into

the surface soil around established plants. Fine for vines, shrubs and trees.

VEGETABLES AND FRUIT. Every gardener knows that nothing equals manure for growing big crops of crisp tender vegetables. Wizard will insure profitable crops on time for the early market. It also improves the color and flavor of fruit. Use 1000 to 1500 lbs. per acre.

FLORISTS. Wizard has been used by florists for over twenty-six years. It is of highest quality, safe and dependable for all crops under glass or in the field.

# WIZARD BRAND COW MANURE

Wizard Shredded and Pulverized Cow Manures are dried and sterilized manures with all weed seeds killed. They are cool, slow acting manures and perferred to sheep manure for roses, lilies and all plants requiring a milder and cooler manure. Shredded Cow Manure is rough and coarse and is unexcelled as a mulch and plant food combined for growing roses. Pulverized Cow Manure is finely ground and resembles sheep manure in appearance. It is preferred by practical florists for preparing bench and potting soils. It is especially valuable for binding loose sandy soils.
